# The problem of causal abduction

- ▶ Say your new exotic plant starts to wither as the summer season comes. Is this because it dislikes
  - ▶ The sun ?
  - ▶ The humidity?
  - ▶ The insects coming out with the new season?
  - ▶ The other plants newly growing around it?
  - ▶ Any combination of the above?

Figure: A plant

## Causal selection judgments

- ▶ An expert explanation: 'The exotic plant withered because of the insects'
- ▶ Singles out one salient causes amongst all of the factors that might have influenced the outcome: *causal selection*.

Figure: An uncle's advice

# Counterfactual models

Quillien and Lucas (2023); Icard et al. (2017)

- ▶ Our best theories of such judgments (Icard et al. (2017); Quillien and Lucas (2023)) rely on counterfactual dependence:
  1. Sample a number of counterfactual worlds to the present situation, where the probability for each world to feature a certain event depends on its normality, and the outcome on one's causal knowledge.
  2. Look at the co-variation between events of interest and the outcome across counterfactuals.

# Causal Inferences from Explanation

Previous Study: Kirfel et al. (2022)

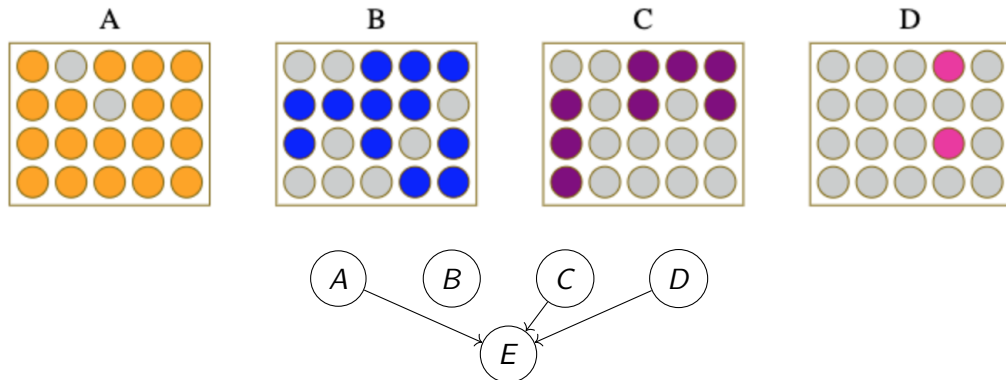

## Limitations of Kirfel et al. (2022)

Suppose that  $A$  is an abnormal variable,  $B$  is a normal variable.

$A \wedge B \longleftarrow$  “Because of  $A$ ”

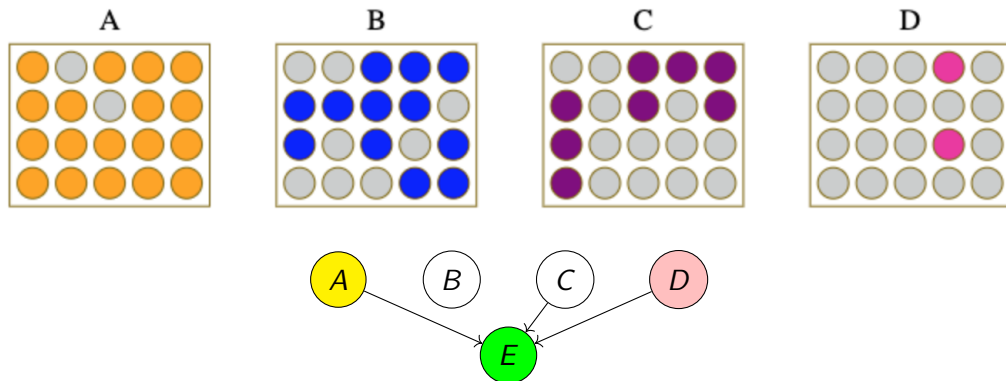

$A \vee B \longleftarrow$  “Because of  $B$ ”

## The present study

- ▶ Subjects wins and losses are determined as a function of the rule  $WIN \leftarrow (A \wedge D) \vee C$
- ▶ Draws from each urn can have **coloured** or **uncoloured** balls, allowing for a total of  $2^{16} = 65,536$  different possible rules.

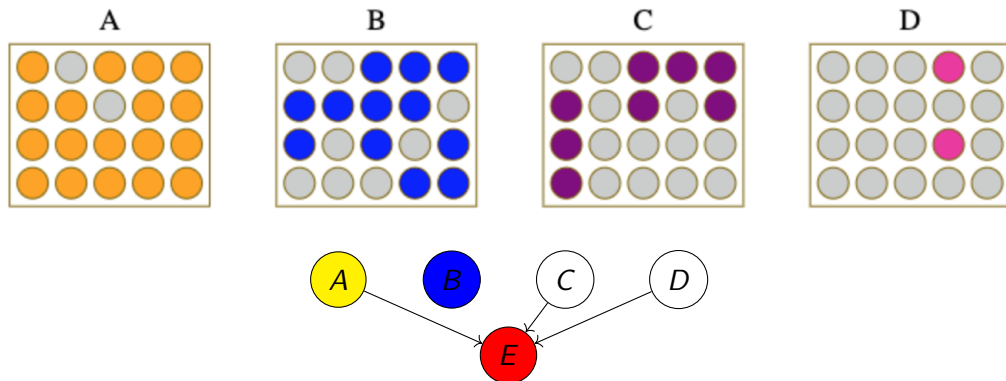

## The present study

- ▶ Subjects wins and losses are determined as a function of the rule  $WIN \leftarrow (A \wedge D) \vee C$
- ▶ Draws from each urn can have **coloured** or **uncoloured** balls, allowing for a total of  $2^{16} = 65,536$  different possible rules.

## The present study

- ▶ Subjects wins and losses are determined as a function of the rule  $WIN \leftarrow (A \wedge D) \vee C$
- ▶ Draws from each urn can have **coloured** or **uncoloured** balls, allowing for a total of  $2^{16} = 65,536$  different possible rules.

# Results

(N=298)

# Experiment Model

Inference from explanation over complex rules

$$P(R|O, E) = \frac{P(E|O, R)P(O|R)P(R)}{P(O, E)}$$

# Experiment Model

Inference from explanation over complex rules

$$P(R|O, E) = \frac{P(E|O, R)P(O|R)P(R)}{P(O, E)}$$

$$P(R | \text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square]}) =$$

$$\frac{P(\text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square] | \text{[orange dot] [grey dot] [purple dot] [grey dot] [green square]}, R) P(\text{[orange dot] [grey dot] [purple dot] [grey dot] [green square] | R) P(R)}{P(\text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square]}, \text{[orange dot] [grey dot] [purple dot] [grey dot] [green square]})}$$

# Experiment Model

Inference from explanation over complex rules

$$P(R|O, E) = \frac{P(E|O, R)P(O|R)P(R)}{P(O, E)}$$

$$P(R | \text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square]}) =$$

$$\frac{P(\text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square]} | \text{[orange dot] [grey dot] [purple dot] [grey dot] [green square]}, R) P(\text{[orange dot] [grey dot] [purple dot] [grey dot] [green square]} | R) P(R)}{P(\text{[orange dot] [grey dot] [dashed box with purple dot] [grey dot] [green square]}, \text{[orange dot] [grey dot] [purple dot] [grey dot] [green square]})}$$

Explanation likelihood:

$$P(E | O, R) = \frac{\exp(\kappa(E, O, R)/\tau)}{\exp\left(\sum_{E_i \in \mathbf{E}} \kappa(E_i, O, R)/\tau\right)}$$

# Model Results

- ▶ Observations only (blue)
- ▶ Causal selection explanations (green)
- ▶ Other explanations (red)

(a) MAP score

(b)  $E[score]$

# Discussion

## Conclusions

- ▶ Causal selection judgements seem to be more informative forms of explanation to infer complex causal rules.

# Discussion

## Conclusions

- ▶ Causal selection judgements seem to be more informative forms of explanation to infer complex causal rules.

## Next steps

- ▶ Extend inference task to other rules of varying complexity
- ▶ Collect explanation judgements from participants to provide as explanations to other participants.

# Thank you for your attention.

Thanks to Salvador Mascarenhas and Neil Bramley for their guidance on the project.  
Thanks to Tom Icard and Tadeo Quillien for fruitful discussions and advice.

(a) Salvador Mascarenhas

(b) Neil Bramley
